[1] Indexes in this table are dervied from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of *Producer Price Indexes*.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 75,000 quotations per month.

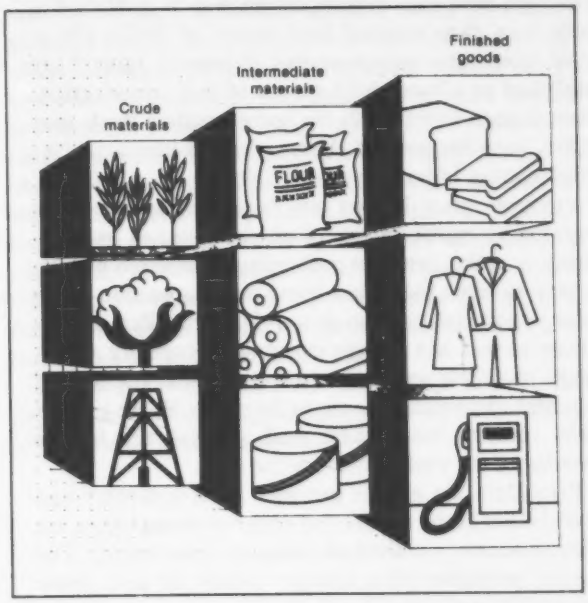
There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.



Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by

establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most producer price indexes currently reflect values of shipments reported in the 1972 Census of Manufactures; these weights will be updated for 1982 Census of Manufactures data in 1987.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202 523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change

Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5

Index Percent Change

Index point change	3.5
Divided by previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from $100 in 1967 to $288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties,* BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

For more information, see "Appendix A: Seasonal Adjustment Methodology at BLS" in the *BLS Handbook of Methods,* (1982), Bulletin 2134-1.

Producer Price Indexes is a monthly report on producer price movements, including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered for 1 or 2 years from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Annual subscription price:
$21 a year domestic (includes supplement)
$5.25 additional foreign

Single copy $8.50; foreign $10.63
Supplement $13; foreign $16.25

rice Movements
eptember 1986

The Producer Price Index for Finished Goods moved 0.4 percent seasonally adjusted from August to September. This was about the same as the 0.3-percent rise August and followed declines in 5 of the first 7 onths of the year. Prices received by producers of termediate goods increased 0.5 percent in September er declining in 7 of the first 8 months of the year. rude material prices were also up 0.5 percent over the onth following a 0.2-percent dip in August and a 1.2-rcent advance a month before. (See table A.)

Substantially higher prices for energy were respon-le for much of the September increase at all three ges of processing. Energy prices had generally been creasing rapidly earlier in 1986. Prices for foods and odstuffs, however, turned down in September after veral months of advances. Price indexes for most ods other than foods and energy continued to rise oderately.

Before seasonal adjustment, the Producer Price In-x for Finished Goods fell 0.3 percent to 287.5 967=100).

From September 1985 to September 1986, the Fin-ed Goods Price Index moved down 0.9 percent. Dur-g the same 12-month period, prices for consumer foods mbed 6.2 percent, but the index for energy goods declined 33.6 percent. Prices for other kinds of commodities were much less volatile over the same span: Consumer goods other than foods and energy rose 2.9 percent, and the capital equipment index advanced 2.7 percent. Prices for intermediate goods decreased 3.7 percent in the 12 months ended in September 1986, while the crude materials index dropped 5.6 percent.

Finished goods

Finished consumer goods. The index for finished consumer goods advanced 0.4 percent on a seasonally adjusted basis, the same as in August. The index for finished energy goods rose 3.7 percent after falling 1.5 percent the month earlier. This upturn was due to a 9.2-percent rise in gasoline prices, which had fallen in each of the previous 2 months. Prices for home heating oil rose 7.7 percent, about half as much as in August. Natural gas prices, however, fell for the sixth consecutive month.

After rising 1.3 percent in August, the index for finished consumer foods edged down 0.2 percent. Prices turned down sharply for processed poultry, pork, and eggs, after rising in August; prices also moved down after increasing the month earlier for processed fruits and vegetables and fish. Beef and veal prices showed

no change after rising sharply in July and August. In contrast, prices turned up after falling in August for noncitrus fruits, roasted coffee, and soft drinks. Fresh vegetable prices rose somewhat faster than they had the month earlier, and prices fell less than in August for shortening and cooking oils and milled rice.

The index for consumer goods other than foods and energy increased 0.2 percent in September after edging up 0.1 percent the month earlier. Indexes for passenger cars and light trucks rose after seasonal adjustment. Before seasonal adjustment, motor vehicle prices declined because of the combined impact of end-of-model-year liquidation allowances and reductions in factory-subsidized financing rates which began earlier in the year.

Capital equipment. The Producer Price Index for capital equipment advanced 0.4 percent, after edging up 0.1 percent in August. Prices turned up on a seasonally adjusted basis for some motor vehicles after moving down in the previous month. Other increases occurred for packing and packaging machinery, chemical industry machinery, and communications equipment. Prices for heavy trucks turned down after increasing in August. Prices also declined for railroad equipment, garden tractors, turbines, typewriters and word processors, and oilfield and gas field drilling machinery.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components advanced 0.5 percent seasonally adjusted in September, the first significant increase registered thus far this year. Although energy prices led the upturn, there were large advances among precious metals and certain construction materials as well.

Following substantial declines in nearly every month since the beginning of the year, the index for intermediate energy goods jumped 3.5 percent. Prices for diesel fuel and residual fuel climbed more than 13 percent, and gasoline prices were 9.2 percent higher. Jet fuel prices turned up. Prices for liquefied petroleum gas continued to fall, however, though much less than in earlier months this year.

The index for intermediate goods other than foods and energy rose 0.3 percent after showing no change in August. For the first time in over a year, the construction materials and components index registered a substantial advance, moving up 0.5 percent. Large increases occurred for softwood lumber and plywood, and prices for wiring devices, plastic plumbing products, heating equipment, and plumbing fixtures also advanced. In contrast, gypsum product prices continued to fall.

The durable manufacturing materials index moved up 0.3 percent. Platinum prices climbed 17.2 percent, nearly as much as in August, while gold and silver also continued to rise substantially. Increases were also observed for aluminum, lead, and hot rolled steel bars, plates, and structural shapes, while cold rolled steel sheets and strip and cold finished steel bars declined.

In the wake of a 0.4-percent dip in the previous month, the nondurable manufacturing materials index edged up 0.1 percent. Increases for industrial chemicals, leather, and woodpulp were nearly offset by declines for plastic resins, gray fabrics, and inedible fats and oils. Among miscellaneous intermediate goods, prices advanced for paper boxes and containers and pressure-sensitive paper products. The intermediate foods and feeds index rose 0.4 percent because of higher prices for prepared animal feeds, chocolate confectionary materials, and crude vegetable oils. Flour prices turned down, however.

Crude goods

After dropping 0.2 percent in August, the Producer Price Index for Crude Materials for Further Processing rose 0.5 percent in September seasonally adjusted. Crude petroleum prices surged upwards, and prices for a number of other items turned up following declines in the preceding month.

The index for crude energy materials advanced 3.7 percent after falling 2.6 percent in August. Prices for crude petroleum climbed 18.6 percent (the largest monthly increase since early 1981) following decreases during most of 1986. Natural gas prices, however, moved down about as much as in the previous month.

The index for crude nonfood materials other than energy increased 0.5 percent. Sharply rising prices for raw cotton (up 15.7 percent) regained a portion of the nearly 60-percent decline registered in the preceding month. Leaf tobacco prices also rebounded after a substantial decrease in August. Other advances were noted for nonferrous metal ores, copper base scrap, wastepaper, and iron and steel scrap. There were small declines for logs and timber, aluminum base scrap, and cattle hides.

The crude foodstuffs and feedstuffs index moved down 0.8 percent following a 2.5-percent increase in August. Prices for live poultry fell sharply following equally sharp increases in July and August. Fluid milk and wheat also decreased after rising the month earlier. Corn prices dropped nearly 10 percent, the third consecutive steep monthly decline. Advances for livestock and oats were not as substantial as in the preceding month. In contrast, fresh vegetable prices rose somewhat faster than in August. Prices turned up for soybeans, raw cane sugar, and barley, following declines in the previous month.

Net output price indexes for major industry groups

The Producer Price Index for the net output of the domestic manufacturing sector edged up 0.2 percent in September after showing no change the month earlier and falling 0.8 percent in July. By far the largest advance in September was the 6.7-percent climb in the index for the net output of the petroleum refining industry group; this index had moved down 1.4 percent in August and nearly 15 percent in the month before that. The only other sizable increase in September was a 0.5-percent rise in the index for the paper industry group. In contrast, the index for the net output of the transportation equipment industry group declined 1.9 percent from August to September, and the chemicals industry group moved down 0.6 percent. Most other major manufacturing industry groups showed little or no change over the month.

The price index for the net output of the domestic mining sector climbed 1.7 percent in September following sharp declines in most other months so far this year. This upturn was led by the 1.7-percent advance in the index for the oil and gas extraction industry group, which had fallen 4.0 percent in August. The metal mining industry group index increased 1.4 percent in September in the wake of a 2.3-percent upward movement during the preceding month.

[1] Indexes in this table are derived from the net-output-weighted industry price indexes shown in table 5. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly-titled indexes which are derived from traditional commodity groupings shown in table 6.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 75,000 quotations per month.

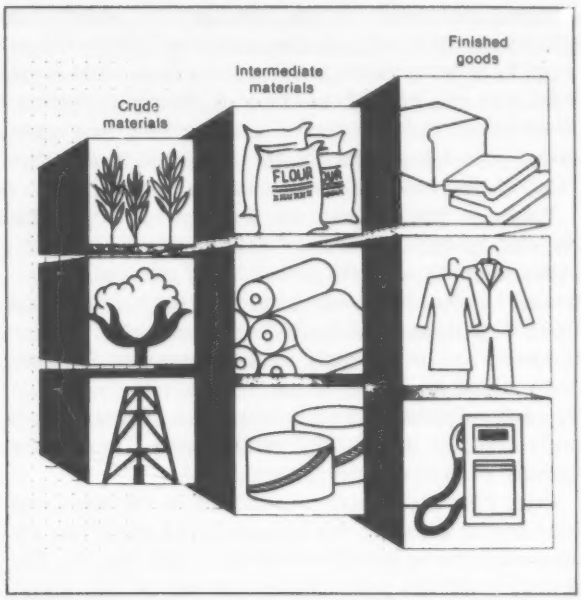
There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.



Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by

establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most producer price indexes currently reflect values of shipments reported in the 1972 Census of Manufactures; these weights will be updated for 1982 Census of Manufactures data in 1987.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202 523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5
Index Percent Change	
Index point change	3.5
Divided by previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from $100 in 1967 to $288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties,* BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

For more information, see "Appendix A: Seasonal Adjustment Methodology at BLS" in the *BLS Handbook of Methods,* (1982), Bulletin 2134-1.

Price Movements October 1986

The Producer Price Index for Finished Goods moved up 0.3 percent seasonally adjusted from September to October. This was about the same as the increases registered in August and September. Prices received by producers of intermediate goods fell 0.3 percent in October in the wake of a 0.5-percent advance the month earlier. The crude materials index climbed 1.6 percent, the largest monthly rise since May. (See table A.)

Among finished goods, consumer food prices turned up after edging slightly lower in September. After declining in July and August and advancing in September, the index for finished energy goods turned down. The index for finished goods other than foods and energy recorded the largest increase in a year, largely reflecting higher prices for new-model passenger cars and trucks.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 1.0 percent to 290.5 (1967=100).

From October 1985 to October 1986, the Finished Goods Price Index decreased 1.4 percent. During the same 12-month period, consumer food prices rose 5.5 percent, the index for energy goods fell 36.5 percent, consumer goods other than foods and energy advanced 2.9 percent, and capital equipment prices moved up 2.2 percent. The intermediate goods index declined 4.0 percent in the 12 months ended in October 1986, and crude material prices dropped 7.1 percent.

Finished goods

Finished consumer goods. The index for finished consumer goods rose 0.3 percent seasonally adjusted following a 0.4-percent increase in September. The index for finished consumer foods advanced 0.9 percent after edging down 0.2 percent in the previous month. Processed poultry prices turned up after falling sharply the month earlier, and prices for beef and veal rose almost 3 percent after showing no change in September. The index for fresh fruits rose almost 20 percent after moving up modestly in September. Although prices for eggs, fish, and shortening and cooking oils fell, these declines were smaller than in the previous month. Roasted coffee prices, however, turned down after rising in September. Pork prices dropped nearly 3 percent for the second consecutive month. Prices for milled rice and processed fruits and vegetables fell more than in September, and prices rose considerably less than they had the month earlier for fresh vegetables.

The index for finished energy goods moved down 4.3 percent after rising 3.7 percent the month earlier. Gasoline prices fell 7.4 percent after climbing 9.2 percent in September.

[1] Data for June 1986 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

Home heating oil prices dropped about the same as gasoline in the wake of 2 months of sharp increases. The index for natural gas moved down for the seventh consecutive month.

The index for consumer goods other than foods and energy increased 0.8 percent after rising 0.2 percent the month earlier. The largest increases occurred for passenger cars and light trucks, reflecting higher prices for 1987 model-year vehicles; these increases also reflected the discontinuance of financing subsidies and other incentives on 1986 models. (See "Report on Quality Changes for 1987 Model Passenger Car," on page 4.) Over the year, prices for passenger cars rose 6.5 percent; light motor trucks were up 6.0 percent. Advances were also registered in October for alcoholic beverages, gold jewelry, cosmetics, books, soaps and detergents, prescription drugs, and children's apparel. However, decreases occurred for over-the-counter drugs, household flatware, and household glassware.

Capital equipment. The Producer Price Index for capital equipment advanced 0.5 percent, about the same as in September. Prices rose for motor vehicles as new model-year cars and trucks were introduced and incentives connected to the liquidation of 1986 models were phased out. Commercial furniture prices also rose. However, declines occurred for truck trailers and haying machinery.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components moved down 0.3 percent seasonally adjusted from September to October. This index had declined in nearly every month this year until September, when it rose 0.5 percent. Once again, changes in energy prices were the dominant factor as the intermediate energy index moved down 2.3 percent. Gasoline and diesel fuel prices both fell about 7 percent after recording large advances in September. In addition, electric power rates dropped more than in any other recent month. However, prices for residual fuel and liquefied petroleum gas rose more than 7 percent.

Following a 0.5-percent advance the month before, the construction materials and components index edged down 0.1 percent. Decreases occurred for millwork, asphalt roofing, and plastic plumbing products; furthermore, softwood lumber prices rose much less than in either of the 2 previous months. However, substantial increases were recorded for asbestos products, building paper and board, and gypsum products.

The durable manufacturing materials index moved up 0.5 percent, more than in any other recent month. Prices advanced for hot and cold rolled steel sheet and strip, lead, zinc, gold, gold, copper, and Portland cement. Decreases occurred, however, for hot rolled steel bars and plates, platinum, and silver. In the nondurable manufacturing materials grouping, a broad array of increases and decreases yielded a net upward movement of 0.3 percent. Prices moved up for industrial chemicals, inedible fats and oils, plastic resins, paper, and paperboard. Commodities exhibiting declining prices included fertilizer materials, paint materials, gray fabrics, processed yarns, and leather.

The intermediate foods and feeds index moved down 0.8 percent, as lower prices for prepared animal feeds, crude vegetable oils, and corn sweeteners were only partly offset by an increase in flour prices. Among other intermediate goods, declines were noted for plastic parts and components, unsupported plastic film and sheets, and mixed fertilizers.

Crude goods

After increasing 0.5 percent in September, the Producer Price Index for Crude Materials for Further Processing rose 1.6 percent in October seasonally adjusted. The crude foodstuffs and feedstuffs index moved up 2.6 percent after

falling 0.8 percent in September. Prices for chickens surged ed 35.3 percent higher following a drop of 28.6 percent in September and substantial increases in July and August. Prices for corn, wheat, fluid milk, and unprocessed fish also rose after declining in the previous month. Fresh fruit and raw cane sugar prices climbed faster than in September. Livestock prices turned down after increasing in the previous month, and prices for soybeans and fresh vegetables advanced less rapidly than in September.

The index for crude nonfood materials other than energy rose 1.7 percent after increasing 0.5 percent in September. Raw cotton prices climbed a record 42.6 percent; combined with the rise in September, raw cotton prices have now recovered about half of their steep August drop, which had followed significant changes in the government's price support program. Prices for aluminum base scrap, cattle hides, and logs and timber turned up after falling in September. Advances were also registered for ferroalloy metal ores, copper base scrap, and wastepaper. In contrast, prices for leaf tobacco and iron and steel scrap turned down following September increases. Iron ore and phosphate prices also dropped.

The crude energy materials index fell 0.9 percent after increasing 3.7 percent in the previous month. Prices for crude petroleum were slightly lower following a double-digit advance in September. Natural gas prices continued to decline, although not as much as in any of the 4 preceding months.

Net output price indexes for major industry groups

The Producer Price Index for the net output of the domestic manufacturing sector rose 0.4 percent in October following a 0.2-percent increase the month earlier. There were only two substantial movements recorded within the manufacturing sector in October: First, a 5.3-percent climb in the index for the transportation equipment industry group, which contrasted with a 1.9-percent drop in September; and second, a 5.0-percent decrease in the index for petroleum refining and related products following a 6.7-percent advance in the previous month. The paper and allied products industry group index moved up 0.6 percent over the month, and the index for printing and publishing increased 0.5 percent. No other major manufacturing industry group rose or fell more than 0.4 percent in October.

Following a 1.7-percent climb from August to September, the index for the net output of the domestic mining sector moved down 0.7 percent from September to October. Within this sector, the index for metal mining industries dropped 3.5 percent in October after a 1.4-percent increase in the preceding month. Similarly, the oil and gas extraction industry group index, which had risen 1.7 percent in September, turned down with a 0.7-percent decline.

Report on Quality Changes for 1987 Model Passenger Cars

The value of quality changes for the sample of 1987 model domestic passenger cars included in the Producer Price Index averaged $37.89. This change represents about 5.5 percent of the average $694.29 yearly increase in producers' prices.

The retail equivalent value of these quality changes average $47.13, representing about 6.1 percent of the average annual increase in manufactures' suggested list prices of $776.38.

Estimates of the value of quality change are based on a review by BLS of data supplied by automobile producers for 20 similarly equipped 1986 and 1987 model domestic cars priced in the Producer Price Index. One of the vehicles underwent significant content change and is not included in the price and quality change estimates. Most estimates of quality changes in this report are derived from data used in the Producer Price Index for October.

The $47.13 estimated retail level of quality change breaks down as follows:

- $1.92 for changes adopted in accordance with the Motor Vehicle Theft Law Enforcement Act of 1984, identification numbers stamped on certain parts of cars with a high incidence of theft;

- $45.21 for other quality changes, such as variations in the levels of standard or optional equipment, changes in vehicle power trains, and increases in corrosion resistance.

There is no quality allowance in these figures for Federal Motor Vehicle Safety Standard (FMVSS) 208, the passive restraint requirement, because vehicle manufacturers have not yet made that feature available on those automobiles included in the PPI sample. When the feature becomes available, it will be evaluated according to normal quality adjustment procedures.

PPI Weights To Be Updated

The Bureau of Labor Statistics has begun the process of updating the value weights used to calculate Producer Price Indexes for traditional commodity groupings to reflect more recent production patterns. The revised weights, which will be introduced when January 1987 data are released in February, will be based on 1982 shipment values taken from the Census of Manufactures and other sources. Presently, PPI weights are derived from 1972 shipment values.

All indexes calculated from traditional commodity groupings (including all indexes in tables 1, 2, 3, 6, 7, and 8) will be affected by the weight update. Although the allocation of commodities within the stage-of-processing framework will continue to be based on the 1972 input-output tables, the weights of individual commodities and commodity grouping will be revised. Industry indexes in tables 4 and 5 which are based on the Standard Industrial Classification system, will continue to be calculated using 1977 net output weights.

The weight revision will not change the existing arithmetic reference period of the PPI index system. The PPI classification system will remain unchanged. Therefore, the continuity and comparability of PPI indexes will not be affected.

[1] Comprehensive relative importance figures are computed once each year in December.

[2] Data for June 1986 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Includes crude petroleum.

[5] Excludes crude petroleum.

[6] Percent of total finished goods.

[7] Percent of total intermediate materials.

[8] Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

[9] Percent of total crude materials.
